Summary

For the final project, we will go to design a database about a pet motel. For the database, we will have several tables such Owner, Pet, Employee, etc. Besides, each table has a relationship with others. Moreover, we will design several html and php pages and connect to the database which we will design later. For the pages, we will create a homepage and several search pages. For the search pages, we will have like “owner page”, “pets schedule”.

On the search pages, we will set some applications on the pages for users to get the information from database. For now, we want to set some applications such as searching which pet belongs to which owner, or like searching the pets’ name then the owner can see all information about the pet. And the motel employee’s information who take care of your pet.

The kinds of data should be integer and string. Like the price, people name, date, etc.
